

CELLULAR BIOLOGY STUDY GUIDE

1. Photosynthesis is the biological process where plants convert solar light energy into chemical energy.
2. Chlorophyll is the primary green pigment in plant leaves responsible for absorbing solar radiation.
3. The light-dependent reactions take place within the thylakoid membranes of chloroplasts.
4. Oxygen gas is released as a vital byproduct during the photolysis and splitting of water molecules.
5. The Calvin cycle occurs in the stroma and utilizes ATP and NADPH to synthesize glucose.
